## Wood Technical Fact Sheet

Dipteryx odorata

syn. Coumarouna odorata

Tonka

Ebo

**Family:** Leguminosae

**Other Common Names:** Almendro (Costa Rica, Panama), Sarrapia (Venezuela, Colombia), Cumaru (Brazil), Charapilla, Cumarut (Peru).

**Distribution:** The Guianas, Venezuela, Colombia, and the Amazon region of Brazil; reaches its best development on well-drained gravelly or sandy sites. Cultivated in many areas for the tonka beans used as a flavoring.

**The Tree:** A large overstory tree sometimes to 160 ft in height and trunk diameters to 40 in.; unbuttressed cylindrical boles are generally clear to 60 to 80 ft.

### The Wood:

**General Characteristics:** Fresh heartwood is reddish brown or purplish brown with light yellowish-brown or purplish streaks; upon exposure gradually becomes uniform light brown or yellowish brown. Sapwood is distinct, narrow, yellowish brown. Luster rather low to medium; texture fine; grain interlocked; waxy or oily feel; taste not distinctive but may have a vanilla-like or rancid odor.

**Weight:** Basic specific gravity (ovendry weight/green volume) ranges from 0.80 to 0.91; air-dry density 62 to 81 pcf.

**Mechanical Properties:** (First set of values based on 2-in. standard; second set on 1-in. standard.)

Moisture content Bending strength Modulus of elasticity Maximum crushing strength

(%) (Psi) (1,000 psi) (Psi)

Green (74) 19,290 2,690 9,020

12% 27,270 3,030 13,720

12% (24) 22,400 3,010 13,200

Janka side hardness 2,200 lb for green material and 3,540 lb at 12% moisture content. Forest Products Laboratory toughness average for green and dry material is 265 in.-lb. (5/8-in. specimen).

**Drying and Shrinkage:** The wood is rated as easy to air-season with a slight tendency to check and with moderate warping; drying was uniformly rapid. No dry kiln data available. Shrinkage from green to oven-dry: radial 5.0%; tangential 7.6%; volumetric 12.0%.

**Working Properties:** The wood is difficult to saw and bore; where severely interlocked grain is not present, the wood planes to a smooth surface. Because of its high density and oily nature, the wood glues poorly.

**Durability:** The timbers have a reputation for being very durable. Laboratory tests also show the heartwood to be very durable in resistance to both brown-rot and white rot fungi. The wood has excellent weathering characteristics.

**Preservation:** Heartwood absorption and penetration of treating solutions using both open-tank and pressure-vacuum systems are inadequate. Sapwood is reported to treat well, particularly with a high end-grain exposure.

**Uses:** Heavy construction, cogs and shafts, barge and dock fenders, flooring, railroad crossties, pulp mill equipment, tool handles, bearings, turnery. A substitute for lignum vitae.
